1 Features

- Power supply: $V_{DD} = V_{DDQ} = 1.35V$ (1.283V - 1.45V)
- Backward compatible to $V_{DD} = V_{DDQ} = 1.5V \pm 0.075V$
- Supports DDR3L devices to be backward compatible in 1.5V application
- Package: 96-Ball FBGA (x16)
- Array configuration: 8 Banks
- 8n-Bit prefetch architecture
- Differential clock inputs (CK, CK#)
- Nominal and dynamic on-die termination (ODT) for data, strobe, and mask signals
- Programmable CAS (READ) latency (CL)
- Programmable posted CAS additive latency (AL)
- Programmable CAS (WRITE) latency (CWL)
- Fixed burst length (BL) of 8 and burst chop (BC) of 4 (via the mode register set [MRS])
- Selectable BC4 or BL8 on-the-fly (OTF)
- Self refresh mode
- Average refresh period:
-7.8us at $0^{\circ}\text{C} \leq \text{TCASE} \leq 85^{\circ}\text{C}$
-3.9us at $85^{\circ}\text{C} < \text{TCASE} \leq 95^{\circ}\text{C}$
- JEDEC JESD79-3F compliant
- RoHS compliant
- Operating case temperature:
-Commercial ($0^{\circ}\text{C} \leq \text{TC} \leq +95^{\circ}\text{C}$)
-Industrial ($-40^{\circ}\text{C} \leq \text{TC} \leq +95^{\circ}\text{C}$)

Note:

1. The functionality described and the timing specifications included in this data sheet are for the DLL enabled mode of operation.

1.1 Product List

Table 1 shows all possible products within the 2Gbit DDR3L SDRAM component generation. Availability depends on application needs.

- 1) For detailed information regarding product type of UnilC please see chapter "Product Nomenclature" of this data sheet.
- 2) CAS: Column Address Strobe.
- 3) RCD: Row Column Delay.
- 4) RP: Row Precharge.
- 5) RoHS Compliant Product: Restriction of the use of certain hazardous substances (RoHS) in electrical and electronic equipment as defined in the directive 2002/95/EC issued by the European Parliament and of the Council of 27 January 2003. These substances include mercury, lead, cadmium, hexavalent chromium, polybrominated biphenyls and polybrominated biphenyl ethers. For more information please visit <http://www.unisemicon.com/>

1.2 Address Table

Table 2 – Address Table

Parameter	128Mb x 16
Number of Banks	8
Bank Address	BA0 - BA2
Auto Precharge	A10/AP
BC Switch on the fly	A12/BC#
Row Address	A0 - A13
Column Address	A0 - A9
Page Size(1)	2KB

Note:

1. Page size is the number of bytes of the data delivered from the array to the internal sense amplifiers when an ACTIVE command is registered. Page size is per bank, calculated as follows:

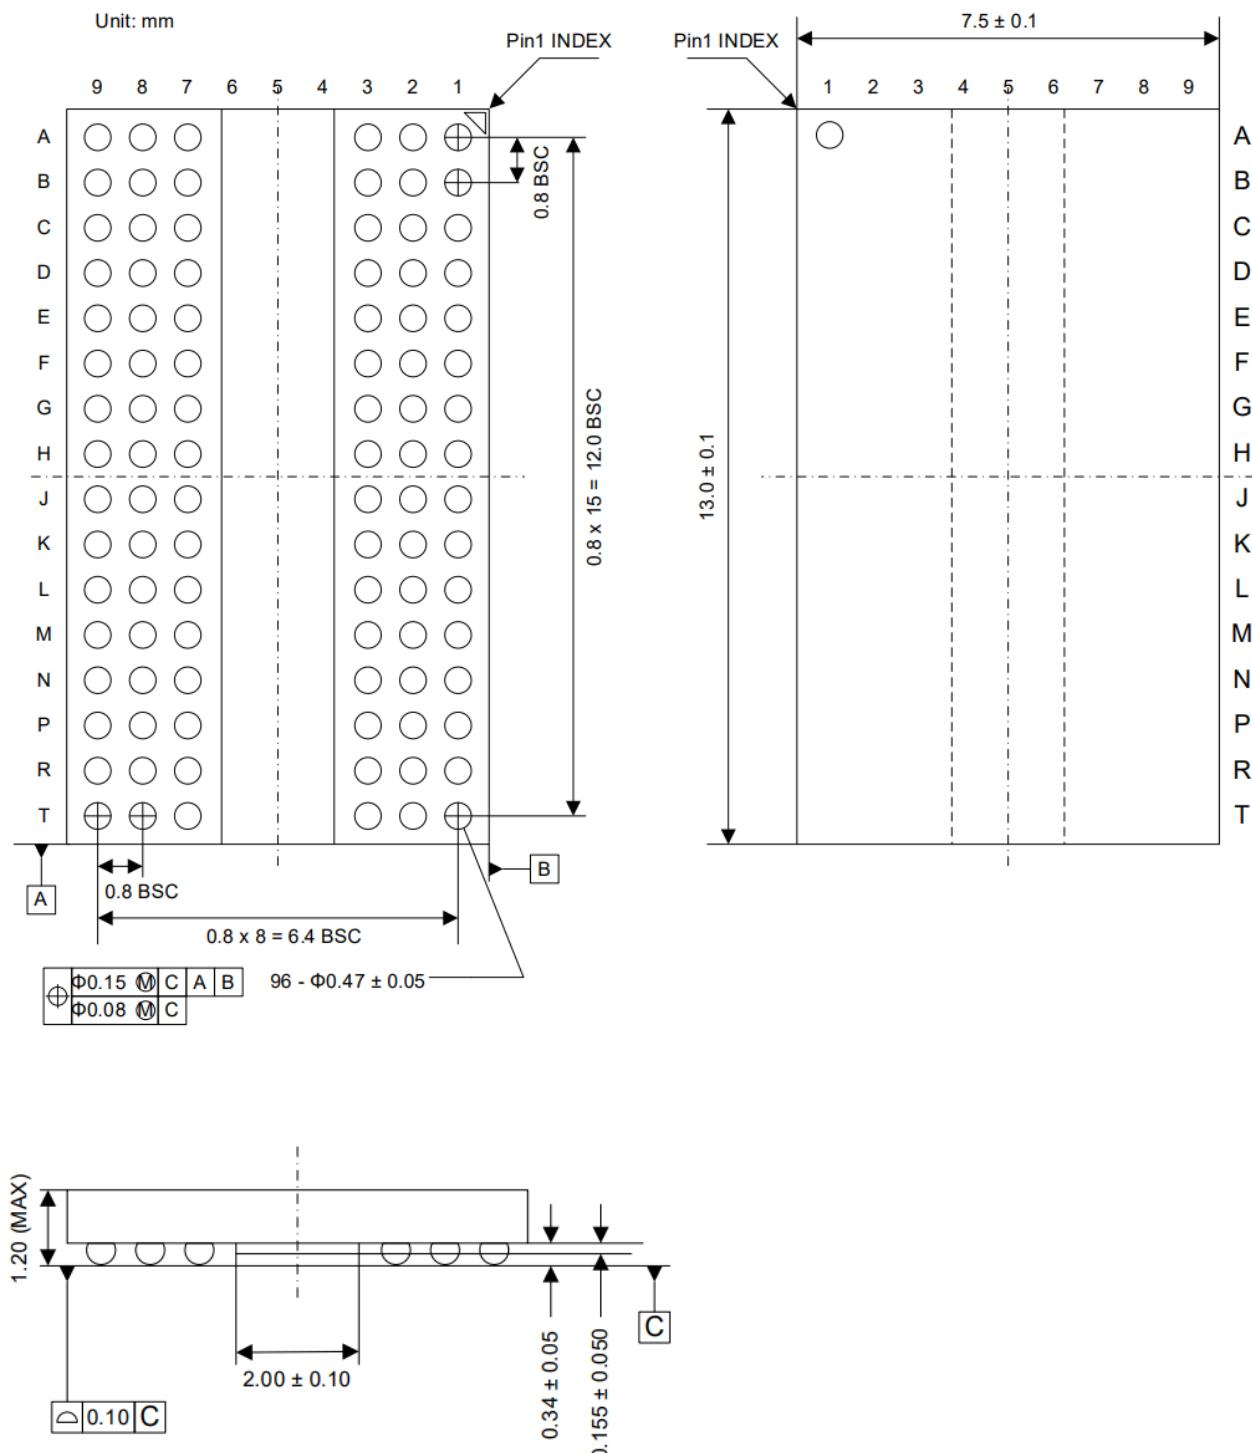

$$\text{Page size} = 2^{\text{COLBITS}} \times \text{ORG} / 8$$

(COLBITS = the number of column address bits; ORG = the number of I/O (DQ) bits)

3.2 Ball Description

Table 3 – Ball Functional Description

Symbol	Type	Function
CK, CK#	Input	Clock: CK and CK# are differential clock inputs. All address and control input signals are sampled on the crossing of positive edge of CK and negative edge of CK#. Output (read) data is referenced to the crossings of CK and CK#.
CKE	Input	Clock Enable: CKE HIGH activates, and CKE LOW deactivates, internal clock signals and device input buffers and output drivers. Taking CKE LOW provides PRECHARGE POWER-DOWN and SELF REFRESH operation (all banks idle), or ACTIVE POWER-DOWN (row active in any bank). CKE is asynchronous for self-refresh exit. After V _{REFCA} and V _{REFDQ} have become stable during the power on and initialization sequence, they must be maintained during all operations (including SELF REFRESH). CKE must be maintained HIGH throughout read and write accesses. Input buffers, excluding CK, CK#, ODT and CKE, are disabled during power down. Input buffers, excluding CKE, are disabled during SELF REFRESH.
CS#	Input	Chip Select: All commands are masked when CS# is registered HIGH. CS# provides for external rank selection on systems with multiple ranks. CS# is considered part of the command code.
ODT	Input	On Die Termination: ODT (registered HIGH) enables termination resistance internal to the DDR3 SDRAM. When enabled, ODT is only applied to each DQ, DQS, DQS# and DM. For x16 configuration, ODT is applied to each DQ, DQSU, DQSU#, DQL, DQL#, DMU, and DML signal. The ODT pin will be ignored if MR1 and MR2 are programmed to disable RTT.
RAS#, CAS#, WE#	Input	Command Input: RAS#, CAS#, and WE# (along with CS#) defines the command being entered.
DM	Input	Input Data Mask: DM is an input mask signal for write data. Input data is masked when DM is sampled HIGH coincident with that input data during a write access. DM is sampled on both edges of DQS.
BA0 - BA2	Input	Bank Address Inputs: BA0 - BA2 define the bank to which an ACTIVE, READ, WRITE or PRECHARGE command is being applied. Bank address also determines which mode register is to be accessed during MRS cycle.
A0 – A13	Input	Address Inputs: Provide the row address for ACTIVATE commands and the column address for READ/WRITE commands to select one location out of the memory array in the respective bank. (A10/AP and A12/BC# have additional functions, see below). The address inputs also provide the op-code during MODE REGISTER SET commands.
A10/AP	Input	Auto Precharge: A10 is sampled during READ/WRITE commands to determine whether auto precharge should be performed to the accessed bank after the READ/WRITE operation. (HIGH: auto precharge; LOW: No auto precharge) A10 is sampled during a PRECHARGE command to determine whether the precharge applies to one bank (A10 LOW) or all banks (A10 HIGH). If only one bank is to be precharged, the bank is selected by bank addresses.
A12/BC#	Input	Burst Chop: A12/BC# is sampled during READ/WRITE commands to determine if burst chop (on- the-fly) will be performed. (HIGH: no burst chop; LOW: burst chopped).
RESET#	Input	Active LOW Asynchronous Reset: Reset is active when RESET# is LOW, and inactive when RESET# is HIGH. RESET# must be HIGH during normal operation. RESET# is a CMOS rail-to-rail signal with DC HIGH and LOW at 80% and 20% of V _{DD} , i.e., 1.2V for DC HIGH and 0.3V for DC LOW.
DQ, DQL, DQU	I/O	Data Input/Output: Bi-directional data bus.
DQS, DQS# DQL, DQL# DQSU, DQSU#	I/O	Data Strobe: Output with read data, input with write data. Edge-aligned with read data, centered in write data. For the x16, DQL corresponds to the data on DQL0-DQL7, DQSU corresponds to the data on DQSU0-DQSU7. The data strobe DQS, DQL and DQSU are paired with differential signals DQS#, DQL#, and DQSU#, respectively, to provide differential pair signaling to the system during reads and writes. DDR3 SDRAM supports differential data strobe only and does not support single-ended.
NC		No Connect: No internal electrical connection is present.
V _{DDQ}	Supply	DQ Power Supply: DDR3L operation = 1.283 to 1.450V; DDR3 operation = 1.425 to 1.575V.
V _{SSQ}	Supply	DQ Ground

Symbol	Type	Function
V _{DD}	Supply	Power Supply: DDR3L operation = 1.283 to 1.450V; DDR3 operation = 1.425 to 1.575V.
V _{SS}	Supply	Ground
V _{REFDQ}	Supply	Reference Voltage for DQ
V _{REFCA}	Supply	Reference Voltage for CA
ZQ	Supply	Reference Pin for ZQ Calibration

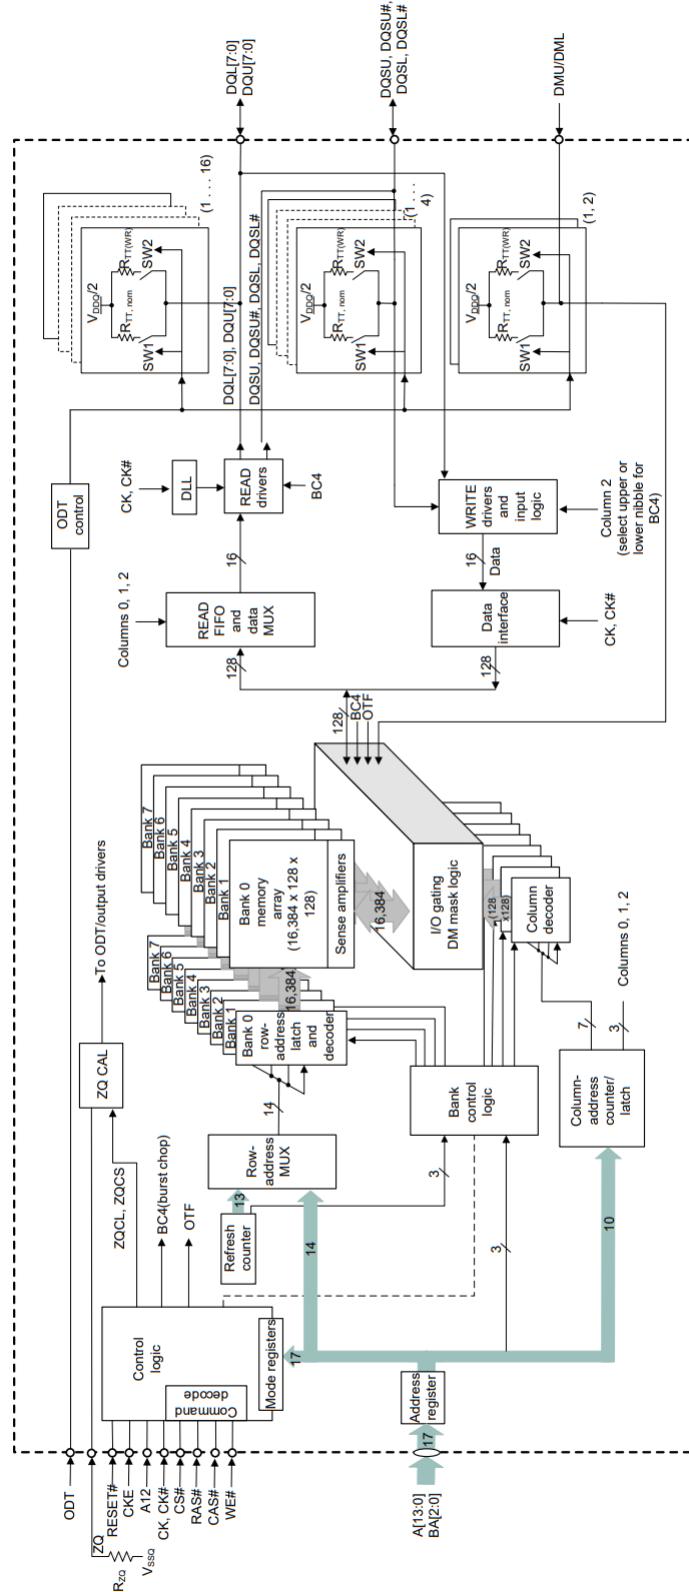

Note:

1. Input only pins (BA0 - BA2, A0 – A13, RAS#, CAS#, WE#, CS#, CKE, ODT and RESET#) do not supply termination.

4 Functional Block Diagrams

DDR3 SDRAM is a high-speed, CMOS dynamic random-access memory. It is internally configured as an 8-bank DRAM.

Figure 3 - 128 Meg x 16 Functional Block Diagram

5 Absolute Maximum Ratings

5.1 Absolute Maximum DC Ratings

Table 4 - Absolute Maximum DC Ratings

Symbol	Parameter	Rating	Unit	Note
V _{DD}	Voltage on V _{DD} pin relative to V _{SS}	-0.4 ~ 1.8	V	1,3
V _{DDQ}	Voltage on V _{DDQ} pin relative to V _{SS}	-0.4 ~ 1.8	V	1,3
V _{IN} , V _{OUT}	Voltage on any pin relative to V _{SS}	-0.4 ~ 1.8	V	1
T _{STG}	Storage Temperature	-55 ~ 100	°C	1,2

Note:

1. Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other condition above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
2. Storage Temperature is the case surface temperature on the center/top side of the DRAM. For the measurement conditions, please refer to JESD79-3F standard.
3. V_{DD} and V_{DDQ} must be within 300mV of each other at all times, and V_{REF} must not be greater than 0.6 x V_{DDQ}, when V_{DD} and V_{DDQ} are less than 500mV, V_{REF} may be equal to or less than 300mV.

5.2 Recommended DC Operating Conditions

Table 5 - Recommended DC Operating Conditions

Symbol	Parameter	Rating			Unit	Note	
		Min	Typ.	Max			
V _{DD}	Supply voltage	DDR3L	1.283	1.35	1.45	V	1,2,3,4,5,6
		DDR3	1.425	1.5	1.575	V	1,2
V _{DDQ}	Supply voltage for output	DDR3L	1.283	1.35	1.45	V	1,2,3,4,5,6
		DDR3	1.425	1.5	1.575	V	1,2

Note:

1. Under all conditions V_{DDQ} must be less than or equal to V_{DD}.
2. V_{DDQ} tracks with V_{DD}, AC parameters are measured with V_{DD} and V_{DDQ} tied together.
3. Maximum DC value may not be greater than 1.425V. The DC value is the linear average of V_{DD}/V_{DD}(t) over a long period of time (e.g., 1 sec).
4. If maximum limit is exceeded, input levels shall be governed by DDR3 specifications.
5. Under these supply voltages, the device operates to this DDR3L specification.
6. Under 1.5V operation, this DDR3L device operates in accordance with the DDR3 specifications under the same speed timings as defined for this device.

5.3 DRAM Component Operating Temperature Range

Table 6 - Temperature Range

Symbol	Parameter	Rating	Unit	Note
T _{OPER}	Normal Operating Temperature Range	0 ~ 85	°C	1,2
	Wide temperature	-40 ~ 85	°C	1,2
	Extended Temperature Range	85 ~ 95	°C	1,3

Note:

1. Operating Temperature T_{OPER} is the case surface temperature on the center/top side of the DRAM. As for measurement conditions, please refer to the JEDEC document JESD51-2.
2. The Normal Temperature Range specifies the temperatures where all DRAM specifications will be supported. During operation, the DRAM case temperature must be maintained between 0 ~ 85°C under all operating conditions.
3. Some applications require DRAM to operate in the Extended Temperature Range between 85°C and 95°C case temperature. Full specifications are supported in this range, but the following additional conditions apply:
 - REFRESH commands must be doubled in frequency, therefore reducing the Refresh interval t_{REFI} to 3.9μs. It is also possible to specify a component with 1X refresh (t_{REFI} to 7.8μs) in the Extended Temperature Range.
 - If SELF REFRESH operation is required in the Extended Temperature Range, then it is mandatory to either use the Manual Self Refresh mode with Extended Temperature Range capability (MR2 A6 = 0b and MR2 A7 = 1b) or enable the optional Auto Self Refresh mode (MR2 A6 = 1b and MR2 A7 = 0b).

Note:

1. For input only pins except RESET#. $V_{REF} = V_{REFCA(DC)}$.
2. See "Overshoot and Undershoot Specifications" in Section 7.6.
3. The AC peak noise on V_{REF} may not allow V_{REF} to deviate from $V_{REF(DC)}$ by more than $\pm 1\% V_{DD}$ (for reference: DDR3L: approx. $\pm 13.5\text{mV}$; DDR3: approx. $\pm 15\text{mV}$).
4. For reference: DDR3 has approx. $V_{DD}/2 \pm 15\text{mV}$, DDR3L has approx. $V_{DD}/2 \pm 13.5\text{mV}$.
5. These levels apply for 1.35V operation only. If the device is operated at 1.5V, the respective levels in JESD79-3F ($V_{IH/LCA(DC100)}$, $V_{IH/LCA(AC175)}$, $V_{IH/LCA(AC150)}$, $V_{IH/LCA(AC135)}$, $V_{IH/LCA(AC125)}$, etc.) apply. The 1.5V levels ($V_{IH/LCA(DC100)}$, $V_{IH/LCA(AC175)}$, $V_{IH/LCA(AC150)}$, $V_{IH/LCA(AC135)}$, $V_{IH/LCA(AC125)}$, etc.) do not apply when the device is operated in the 1.35 voltage range.
6. $V_{IH(DC)}$ is used as a simplified symbol for $V_{IH,CA(DC100)}$.
7. $V_{IL(DC)}$ is used as a simplified symbol for $V_{IL,CA(DC100)}$.
8. $V_{IH(AC)}$ is used as a simplified symbol for $V_{IH,CA(AC175)}$, $V_{IH,CA(AC150)}$, $V_{IH,CA(AC135)}$, and $V_{IH,CA(AC125)}$; $V_{IH,CA(AC175)}$ value is used when $V_{REF} + 0.175\text{V}$ is referenced, $V_{IH,CA(AC150)}$ value is used when $V_{REF} + 0.15\text{V}$ is referenced, $V_{IH,CA(AC135)}$ value is used when $V_{REF} + 0.135\text{V}$ is referenced, and $V_{IH,CA(AC125)}$ value is used when $V_{REF} + 0.125\text{V}$ is referenced.
9. $V_{IL(AC)}$ is used as a simplified symbol for $V_{IL,CA(AC175)}$, $V_{IL,CA(AC150)}$, $V_{IL,CA(AC135)}$ and $V_{IL,CA(AC125)}$; $V_{IL,CA(AC175)}$ value is used when $V_{REF} - 0.175\text{V}$ is referenced, $V_{IL,CA(AC150)}$ value is used when $V_{REF} - 0.15\text{V}$ is referenced, $V_{IL,CA(AC135)}$ value is used when $V_{REF} - 0.135\text{V}$ is referenced, and $V_{IL,CA(AC125)}$ value is used when $V_{REF} - 0.125\text{V}$ is referenced.
10. $V_{REFCA(DC)}$ is measured relative to V_{DD} at the same point in time on the same device.

Note:

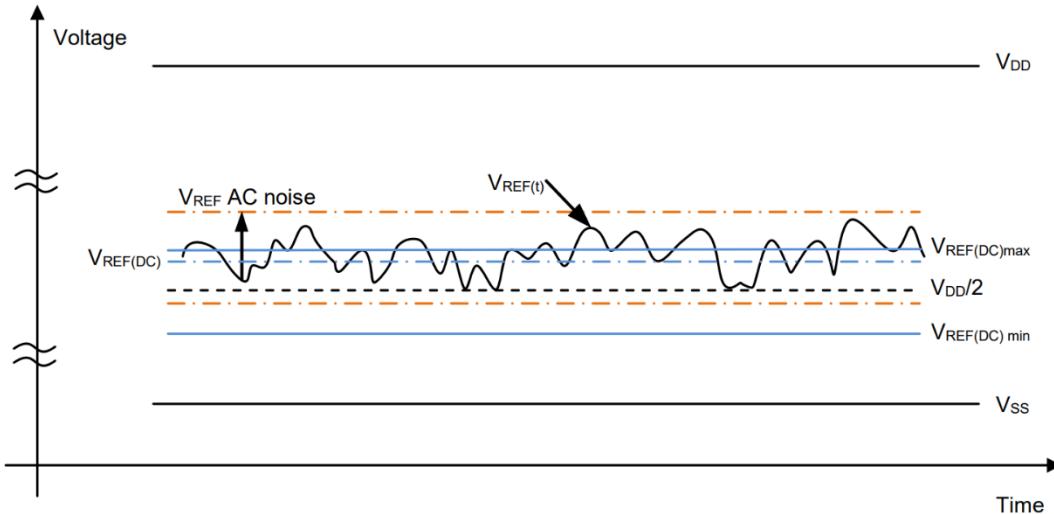

1. For input only pins except RESET#, $V_{REF} = V_{REFDQ(DC)}$.
2. See "Overshoot and Undershoot Specifications" in Section 7.6.
3. The AC peak noise on V_{REF} may not allow V_{REF} to deviate from $V_{REFDQ(DC)}$ by more than $\pm 1\% V_{DD}$ (for reference: DDR3L: approx. $\pm 13.5\text{mV}$; DDR3: approx. $\pm 15\text{mV}$).
4. For reference: DDR3 has approx. $V_{DD}/2 \pm 15\text{mV}$, and DDR3L has approx. $V_{DD}/2 \pm 13.5\text{mV}$.
5. These levels apply for 1.35V operation only. If the device is operated at 1.5V, the respective levels in JESD79-3F ($V_{IH/L,DQ(DC100)}$, $V_{IH/L,DQ(AC175)}$, $V_{IH/L,DQ(AC150)}$, $V_{IH/L,DQ(AC135)}$, etc.) apply. The 1.5V levels ($V_{IH/L,DQ(DC100)}$, $V_{IH/L,DQ(AC175)}$, $V_{IH/L,DQ(AC150)}$, $V_{IH/L,DQ(AC135)}$, etc.) do not apply when the device is operated in the 1.35 voltage range.
6. $V_{IH(DC)}$ is used as a simplified symbol for $V_{IH,DQ(DC100)}$.
7. $V_{IL(DC)}$ is used as a simplified symbol for $V_{IL,DQ(DC100)}$.
8. $V_{IH(AC)}$ is used as a simplified symbol for $V_{IH,DQ(AC175)}$, $V_{IH,DQ(AC150)}$, and $V_{IH,DQ(AC135)}$; $V_{IH,DQ(AC175)}$ value is used when $V_{REF} + 0.175\text{V}$ is referenced, $V_{IH,DQ(AC150)}$ value is used when $V_{REF} + 0.15\text{V}$ is referenced, and $V_{IH,DQ(AC135)}$ value is used when $V_{REF} + 0.135\text{V}$ is referenced.
9. $V_{IL(AC)}$ is used as a simplified symbol for $V_{IL,DQ(AC175)}$, $V_{IL,DQ(AC150)}$, and $V_{IL,DQ(AC135)}$; $V_{IL,DQ(AC175)}$ value is used when $V_{REF} - 0.175\text{V}$ is referenced, $V_{IL,DQ(AC150)}$ value is used when $V_{REF} - 0.15\text{V}$ is referenced, and $V_{IL,DQ(AC135)}$ value is used when $V_{REF} - 0.135\text{V}$ is referenced.
10. $V_{REFDQ(DC)}$ is measured relative to V_{DD} at the same point in time on the same device.

6.2 V_{REF} Tolerances

The DC-Tolerance limits and AC-Noise limits for the reference voltages V_{REFCA} and V_{REFDQ} are illustrated in Figure 4. It shows a valid reference voltage $V_{REF(t)}$ as a function of time. (V_{REF} stands for V_{REFCA} and V_{REFDQ} likewise).

$V_{REF(DC)}$ is the linear average of $V_{REF(t)}$ over a very long period of time (e.g., 1 sec). This average has to meet the min/max requirement in Table 6. Furthermore $V_{REF(t)}$ may temporarily deviate from $V_{REF(DC)}$ by no more than $\pm 1\% V_{DD}$.

Figure 4 - Illustration of $V_{REF(DC)}$ Tolerance and V_{REF} AC-Noise limits

The voltage levels for setup and hold time measurements $V_{IH(AC)}$, $V_{IH(DC)}$, $V_{IL(AC)}$ and $V_{IL(DC)}$ are dependent on V_{REF} . “ V_{REF} ” should be understood as $V_{REF(DC)}$.

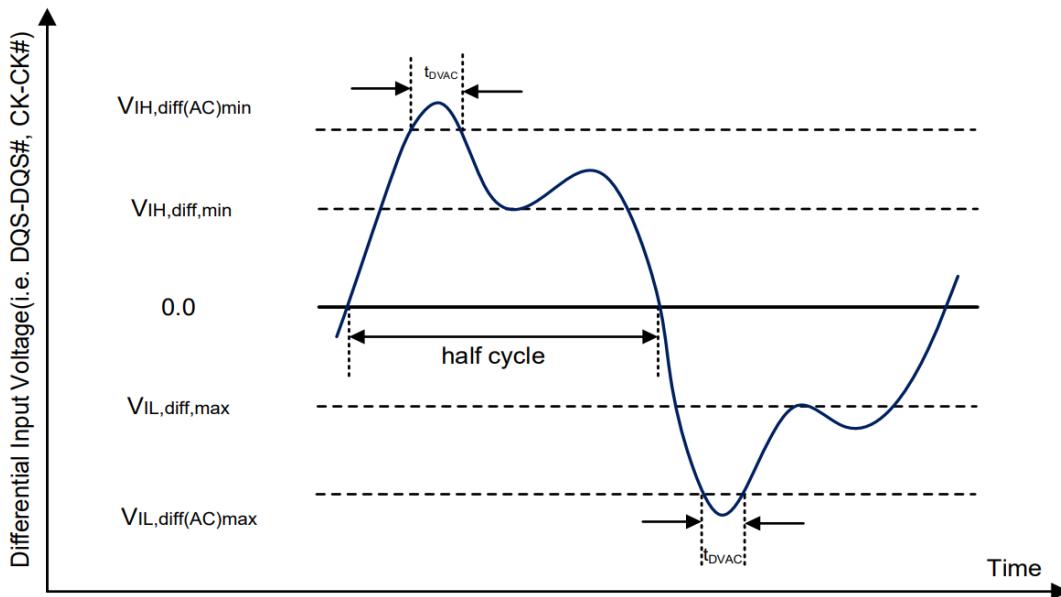

This clarifies that DC-Variations of V_{REF} affect the absolute voltage a signal has to reach to achieve a valid high or low level, and therefore the time to which setup and hold is measured. System timing and voltage budgets need to account for $V_{REF(DC)}$ deviations from the optimum position within the data-eye of the input signals.

This also clarifies that the DRAM setup/hold specification and derating values need to include time and voltage associated with V_{REF} AC-Noise. Timing and voltage effects due to AC-Noise on V_{REF} up to the specified limit ($\pm 1\%$ of V_{DD}) are included in DRAM timings and their associated deratings

- For CK - CK# use $V_{IH/VIL(AC)}$ of ADD/CMD and V_{REFCA} ; for DQS - DQS#, DQSL - DQSL#, DQSU - DQSU# use $V_{IH}/V_{IL(AC)}$ of DQS and VREFDQ; if a reduced AC-high or AC-low level is used for a signal group, then the reduced level applies also here.
- These values are not defined, however, the single-ended signals CK, CK#, DQS, DQS#, DQSL, DQSL#, DQSU, DQSU# need to be within the respective limits ($V_{IH(DC)}_{max}$, $V_{IL(DC)}_{min}$) for single-ended signals as well as the limitations for overshoot and undershoot.

6.3.3 Single-ended Requirements for Differential Signals

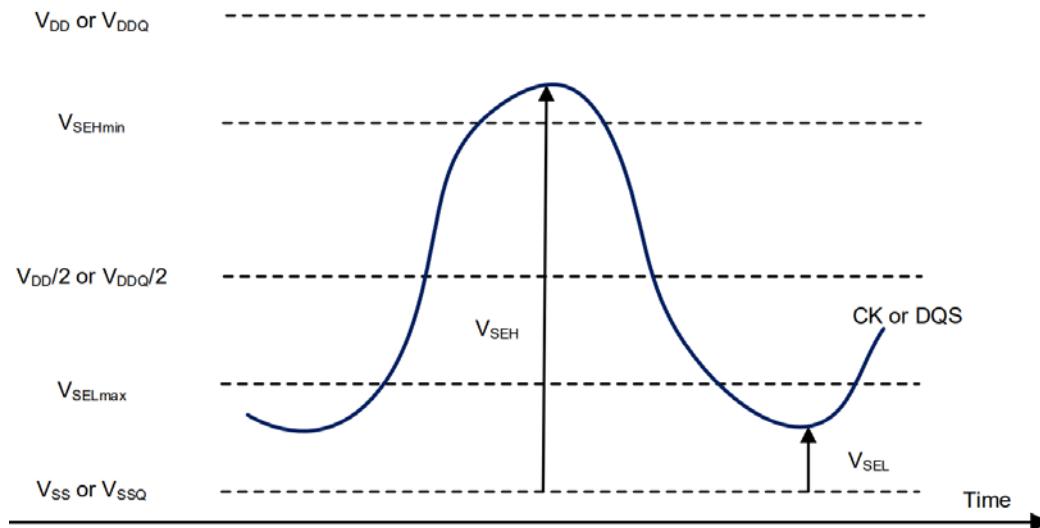

Each individual component of a differential signal (CK, DQS, DQSL, DQSU, CK#, DQS#, DQSL#, or DQSU#) has also to comply with certain requirements for single-ended signals.

CK and CK# have to approximately reach V_{SEHmin}/V_{SELmax} (approximately equal to the AC-Levels ($V_{IH(AC)}/V_{IL(AC)}$) for ADD/CMD signals) in every half-cycle.

DQS, DQSL, DQSU, DQS#, DQSL# have to reach V_{SEHmin}/V_{SELmax} (approximately the AC-Levels ($V_{IH(AC)}/V_{IL(AC)}$) for DQ signal) in every half-cycle proceeding and following a valid transition.

Note that the applicable AC-levels for ADD/CMD and DQ's might be different per speed-bin etc. E.g., if $V_{IH,CA(AC150)}/V_{IL,CA(AC150)}$ is used for ADD/CMD signals, then these AC-levels apply also for the single-ended signals CK and CK#.

Figure 6 - Single-ended Requirement for Differential Signals

Note that, while ADD/CMD and DQ signal requirements are with respect to V_{REF} , the single-ended components of differential signals have a requirement with respect to $V_{DD}/2$, this is nominally the same. The transition of single-ended signals through the AC-Levels is used to measure setup time. For single-ended components of differential signals the requirement to reach $V_{SEL,max}$, $V_{SEH,min}$ has no bearing on timing, but adds a restriction on the common mode characteristics of these signals.

Table 12 - Single-ended Levels for CK, DQS, DQL, DQSU, CK#, DQS#, DQL#, or DQSU#

Symbol	Parameter	DDR3L/DDR3-800/1066/1333/1600/1866		Unit	Note
		Min	Max

	Single-ended high-level for CK, CK#	$(V_{DD}/2) + 0.175$	Note 3	V	1,2
V_{SEL}	Single-ended low-level for strobes	Note 3	$(V_{DD}/2) - 0.175$	V	1,2
	Single-ended low-level for CK, CK#	Note 3	$(V_{DD}/2) - 0.175$	V	1,2

Note:

- For CK, CK# use $V_{IH}/V_{IL(AC)}$ of ADD/CMD; for strobes (DQS, DQS#, DQL, DQL#, DQSU, DQSU#) use $V_{IH}/V_{IL(AC)}$ of DQS.
- $V_{IH(AC)}/V_{IL(AC)}$ for DQ is based on V_{REFDQ} ; $V_{IH(AC)}/V_{IL(AC)}$ for ADD/CMD is based on V_{REFCA} ; if a reduced AC-high or AC-low level is used for a signal group, then the reduced level applies also here.
- These values are not defined, however the single-ended signals CK, CK#, DQS, DQS#, DQL, DQL#, DQSU, DQSU# need to be within the respective limits ($V_{IH(DC)max}$, $V_{IL(DC)min}$) for single-ended signals as well as the limitations for overshoot and undershoot.

6.4 Differential Input Cross Point Voltage

To guarantee tight setup and hold times as well as output skew parameters with respect to clock and strobe, each cross point voltage of differential input signals (CK, CK# and DQS, DQS#) must meet the requirements in Table13 and Table14. The differential input cross point voltage V_{IX} is measured from the actual cross point of true and complement signals to the midlevel between V_{DD} and V_{SS} .

Figure 7 - V_{IX} Definition

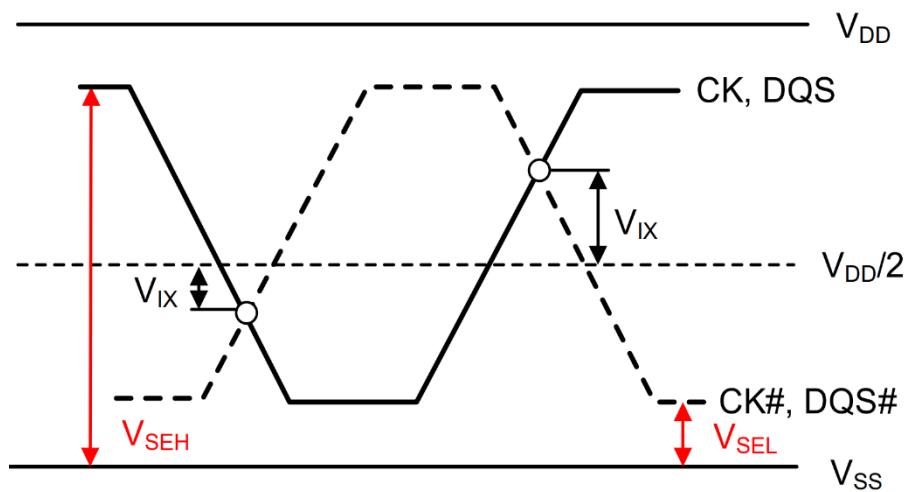

Table 13 - Cross Point Voltage for Differential Input Signals (CK, DQS):1.35V

Note:

1. The relation between $V_{IX(min/max)}$ and V_{SEL}/V_{SEH} should satisfy following.
 $(V_{DD}/2) + V_{IX(min)} - V_{SEL} \geq 25mV$
 $V_{SEH} - ((V_{DD}/2) + V_{IX(max)}) \geq 25mV$

		-175	175	mV	1
$V_{IX(DQS)}$	Differential Input Cross Point Voltage relative to $V_{DD}/2$ for DQS, DQS#	-150	150	mV	2

Note:

1. Extended range for V_{IX} is only allowed for clock and if single-ended clock input signals CK and CK# are monotonic with a single-ended swing V_{SEL}/V_{SEH} of at least $V_{DD}/2 \pm 250mV$, and when the differential slew rate of CK - CK# is larger than 3V/ns.
2. The relation between $V_{IX(min/max)}$ and V_{SEL}/V_{SEH} should satisfy following. $(V_{DD}/2) + V_{IX(min)} - V_{SEL} \geq 25mV$; $V_{SEH} - ((V_{DD}/2) + V_{IX(max)}) \geq 25mV$

6.5 Slew Rate Definitions for Single-ended Input Signals

See section 11.5 "Address/Command Setup, Hold and Derating" single-ended slew rate definitions for address and command signals.

See section 11.6 "Data Setup, Hold and Slew Rate Derating" single-ended slew rate definitions for data signals.

6.6 Slew Rate Definitions for Differential Input Signals

Input slew rate for differential signals (CK, CK#, and DQS, DQS#) are defined and measured as shown in Table 15 and Figure 9

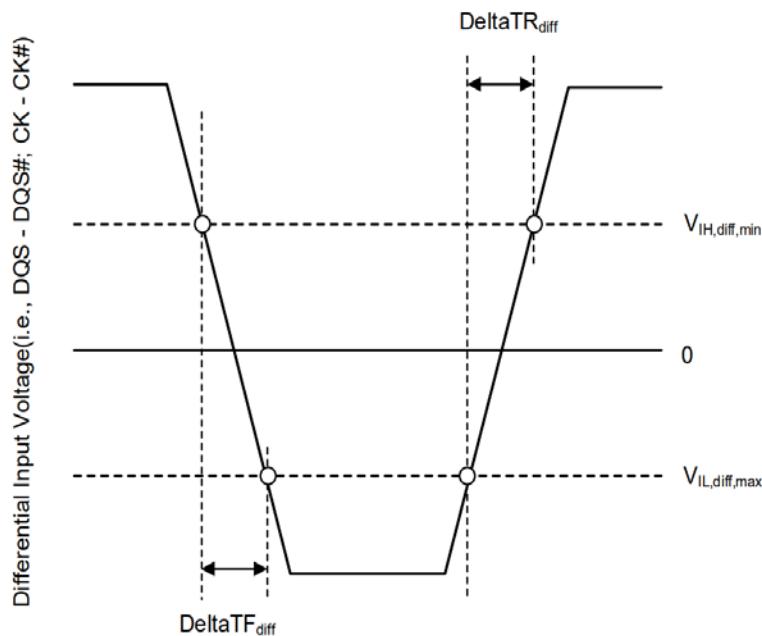

Table 15 - Differential Input Slew Rate Definition

Description	Measured		Defined by
	From	To	
Differential input slew rate for rising edge (CK - CK# and DQS - DQS#)	$V_{IL,diff,max}$	$V_{IH,diff,min}$	$[V_{IH,diff,min} - V_{IL,diff,max}] / \Delta T R_{diff}$
Differential input slew rate for falling edge (CK - CK# and DQS - DQS#)	$V_{IH,diff,min}$	$V_{IL,diff,max}$	$[V_{IH,diff,min} - V_{IL,diff,max}] / \Delta T F_{diff}$

Note:

1. The differential signal (i.e., CK - CK# and DQS - DQS#) must be linear between these thresholds.

7 AC&DC Output Measurement Levels

7.1 Single-ended AC and DC Output Levels

Table 16 shows the output levels used for measurements of single-ended signals.

Table 16 - Single-ended AC&DC Output Levels

Symbol	Parameter	Value	Unit	Note
$V_{OH(DC)}$	DC output high measurement level (for IV curve linearity)	$0.8 \times V_{DDQ}$	V	-
$V_{OM(DC)}$	DC output mid measurement level (for IV curve linearity)	$0.5 \times V_{DDQ}$	V	-
$V_{OL(DC)}$	DC output low measurement level (for IV curve linearity)	$0.2 \times V_{DDQ}$	V	-
$V_{OH(AC)}$	AC output high measurement level (for output SR)	$V_{TT} + 0.1 \times V_{DDQ}$	V	1
$V_{OL(AC)}$	AC output low measurement level (for output SR)	$V_{TT} - 0.1 \times V_{DDQ}$	V	1

Note:

1. The swing of $\pm 0.1 \times V_{DDQ}$ is based on approximately 50% of the static single-ended output high or low swing with a driver impedance of 40Ω and an effective test load of 25Ω to $V_{TT} = V_{DDQ}/2$.

7.2 Differential AC and DC Output Levels

Table 17 shows the output levels used for measurements of differential signals.

Table 17 - Differential AC&DC Output Levels

Symbol	Parameter	Value	Unit	Note
$V_{OH,diff(AC)}$	AC differential output high measurement level (for output SR)	$+ 0.2 \times V_{DDQ}$	V	1
$V_{OL,diff(AC)}$	AC differential output low measurement level (for output SR)	$- 0.2 \times V_{DDQ}$	V	1

Note:

1. The swing of $\pm 0.2 \times V_{DDQ}$ is based on approximately 50% of the static single-ended output high or low swing with a driver impedance of 40Ω and an effective test load of 25Ω to $V_{TT} = V_{DDQ}/2$ at each of the differential outputs.

7.3 Single-ended Output Slew Rate

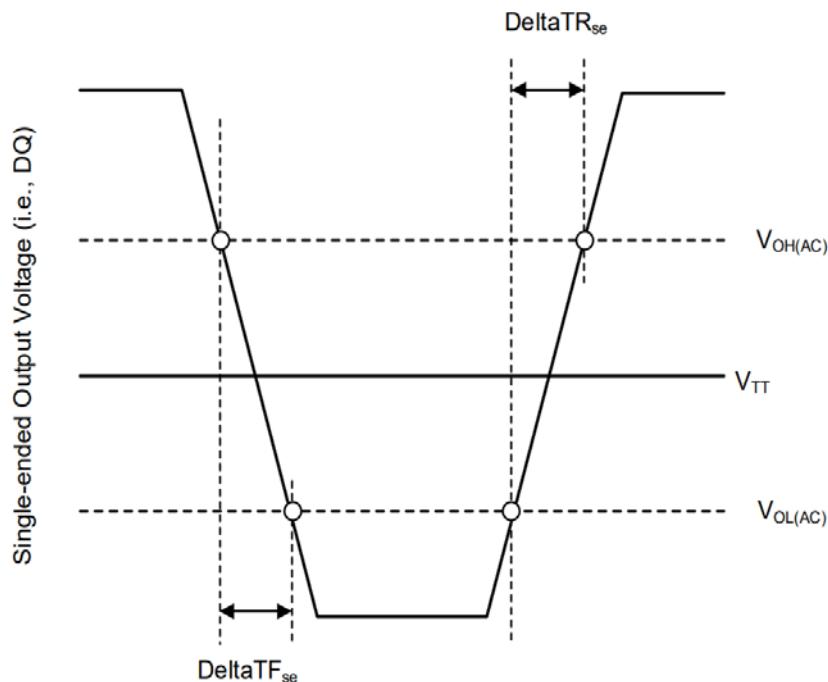

With the reference load for timing measurements, output slew rate for falling and rising edges is defined and measured between $V_{OL(AC)}$ and $V_{OH(AC)}$ for single-ended signals as shown in Table 18 and Figure 9.

Table 18 - Single-ended Output Slew Rate Definition

Description	Measured		Defined by
	From	To	
Single-ended output slew rate for rising edge	$V_{OL(AC)}$	$V_{OH(AC)}$	$[V_{OH(AC)} - V_{OL(AC)}]/\Delta t_{Rse}$
Single-ended output slew rate for falling edge	$V_{OH(AC)}$	$V_{OL(AC)}$	$[V_{OH(AC)} - V_{OL(AC)}]/\Delta t_{Fse}$

Note:

1. Output slew rate is verified by design and characterization, and may not be subject to production test.

Description:

SR: Slew Rate

Q: Query Output (like in DQ, which stands for Data-in, Query-Output)

se: Single-ended Signals

For $R_{ON} = R_{ZQ}/7$ Setting

Note:

1. In two cases, a maximum slew rate of 6V/ns applies for a single DQ signal within a byte lane.
 - Case 1 is defined for a single DQ signal within a byte lane which is switching into a certain direction (either from HIGH to LOW or LOW to HIGH) while all remaining DQ signals in the same byte lane are static (i.e. they stay at either HIGH or LOW).
 - Case 2 is defined for a single DQ signal within a byte lane which is switching into a certain direction (either from HIGH to LOW or LOW to HIGH) while all remaining DQ signals in the same byte lane are switching into the opposite direction (i.e. from LOW to HIGH or HIGH to LOW respectively). For the remaining DQ signal switching into the opposite direction, the regular maximum limit of 5V/ns applies).

7.4 Differential Output Slew Rate

With the reference load for timing measurements, output slew rate for falling and rising edges is defined and measured between $V_{OL,diff(AC)}$ and $V_{OH,diff(AC)}$ for differential signals as shown in Table 20 and Figure 10.

Table 20 - Differential Output Slew Rate Definition

Description	Measured		Defined by
	From	To	
Differential output slew rate for rising edge	$V_{OL,diff(AC)}$	$V_{OH,diff(AC)}$	$[V_{OH,diff(AC)} - V_{OL,diff(AC)}]/\Delta T R_{diff}$
Differential output slew rate for falling edge	$V_{OH,diff(AC)}$	$V_{OL,diff(AC)}$	$[V_{OH,diff(AC)} - V_{OL,diff(AC)}]/\Delta T F_{diff}$

Note:

1. Output slew rate is verified by design and characterization, and may not be subject to production test.

7.5 Reference Load for AC Timing and Output Slew Rate

Figure 12 represents the effective reference load of 25Ω used in defining the relevant AC timing parameters of the device as well as output slew rate measurements.

It is not intended as a precise representation of any particular system environment or a depiction of the actual load presented by a production tester. System designers should use IBIS or other simulation tools to correlate the timing reference load to a system environment. Manufacturers correlate to their production test conditions, generally one or more coaxial transmission lines terminated at the tester electronics.

7.7 34Ω Output Driver DC Electronic Characteristics

A functional representation of the output buffer is shown below. Output driver impedance R_{ON} is defined by the value of external reference resistor R_{ZQ} as follows:

$R_{ON34} = R_{ZQ}/7$ (Nominal $34.3\Omega \pm 10\%$ with nominal $R_{ZQ} = 240\Omega$).

The individual pull-up and pull-down resistors $R_{ON(Pu)}$ and $R_{ON(Pd)}$ are defined as follows:

under the condition that $R_{ON(Pd)}$ is turned off .

under the condition that $R_{ON(Pu)}$ is turned off.

7.8 On-Die Termination (ODT) Levels and I-V Characteristics

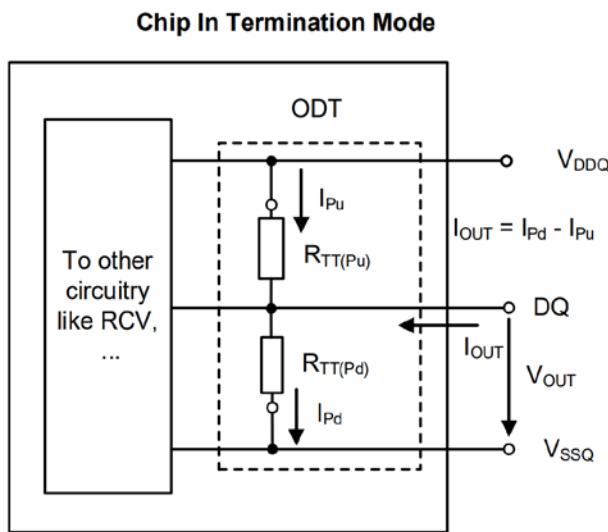

On-Die Termination effective resistance R_{TT} is defined by bits A9, A6 and A2 of MR1 register. ODT is applied to the DQ, DM, DQS / DQS# pins.

A functional representation of the on-die termination is shown below. The individual pull-up and pull-down resistors ($R_{TT(Pu)}$ and $R_{TT(Pd)}$) are defined as follows:

under the condition that $R_{TT(Pd)}$ is turned off.

under the condition that $R_{TT(Pu)}$ is turned off

Note:

- The tolerance limits are specified after calibration with stable voltage and temperature. For the behavior of the tolerance limits if temperature or voltage changes after calibration, see following section on voltage and temperature sensitivity.
- The tolerance limits are specified under the condition that $V_{DDQ} = V_{DD}$ and that $V_{SSQ} = V_{SS}$.
- Pull-down and pull-up ODT resistors are recommended to be calibrated at $0.5 \times V_{DDQ}$. Other calibration schemes may be used to achieve the linearity spec shown above, e.g., calibration at $0.2 \times V_{DDQ}$ and $0.8 \times V_{DDQ}$.

4. Not a specification requirement, but a design guide line.

5. Measurement definition for R_{TT} :

Apply $V_{IH(AC)}$ to pin under test and measure current $I(V_{IH(AC)})$, then apply $V_{IL(AC)}$ to pin under test and measure current $I(V_{IL(AC)})$ respectively.

$$R_{TT} = \frac{V_{IH(AC)} - V_{IL(AC)}}{I(V_{IH(AC)}) - I(V_{IL(AC)})}$$

6. Measurement definition for VM and ΔVM : Measure voltage (VM) at test pin (midpoint) with no load:

$$\Delta VM = \left(\frac{2 \times VM}{V_{DDQ}} - 1 \right) \times 100$$

7.8.1 ODT DC Temperature and Voltage Sensitivity

If temperature and/or voltage change after calibration, the tolerance limits widen according to Table 27 and Table 28.
 $\Delta T = T - T(@\text{calibration})$; $\Delta V = V_{DDQ} - V_{DDQ}(@\text{calibration})$; $V_{DD} = V_{DDQ}$.

8 I_{DD} Current Measure Method

8.1 I_{DD} Measurement Conditions

In this chapter, I_{DD} and I_{DDQ} measurement conditions such as test load and patterns are defined.

Figure 23 shows the setup and test load for I_{DD} and I_{DDQ} measurements.

- **I_{DD} currents** (such as I_{DD0}, I_{DD1}, I_{DD2N}, I_{DD2NT}, I_{DD2P0}, I_{DD2P1}, I_{DD2Q}, I_{DD3N}, I_{DD3P}, I_{DD4R}, I_{DD4W}, I_{DD5B}, I_{DD6}, I_{DD6ET}, I_{DD6TC} and I_{DD7}) are measured as time-averaged currents with all V_{DD} balls of the DDR3 SDRAM under test tied together. Any I_{DDQ} current is not included in I_{DD} currents.
- **I_{DDQ} currents** (such as I_{DDQ2NT} and I_{DDQ4R}) are measured as time-averaged currents with all V_{DDQ} balls of the DDR3 SDRAM under test tied together. Any I_{DD} current is not included in I_{DDQ} currents.

Attention: I_{DDQ} values cannot be directly used to calculate I/O power of the DDR3 SDRAM. They can be used to support correlation of simulated I/O power to actual I/O power as outlined in Figure 23. In DRAM module application, I_{DDQ} cannot be measured separately since V_{DD} and V_{DDQ} are using one merged-power layer in Module PCB.

For I_{DD} and I_{DDQ} measurements, the following definitions apply:

- "0" and "LOW" is defined as V_{IN} ≤ V_{IL.AC(max)}.
- "1" and "HIGH" is defined as V_{IN} ≥ V_{IH.AC(min)}.
- "FLOATING" is defined as inputs are V_{REF} = V_{DD}/2.
- "Timing used for I_{DD} and I_{DDQ} Measured - Loop Patterns" are provided in Table 4.
- "Basic I_{DD} and I_{DDQ} Measurement Conditions" are described in Table 32.
- Detailed I_{DD} and I_{DDQ} Measurement-Loop Patterns are described in Table 33 through Table 40.
- I_{DD} Measurements are done after properly initializing the DDR3 SDRAM. This includes but is not limited to setting:
 - R_{ON} = R_{ZQ}/7 (34Ω in MR1)
 - Qoff = 0b (Output Buffer enabled in MR1)
 - R_{TT,Nom} = R_{ZQ}/6 (40Ω in MR1)
 - R_{TT(WR)} = R_{ZQ}/2 (120Ω in MR2)

Attention: The I_{DD} and I_{DDQ} Measurement-Loop Patterns need to be executed at least one time before actual I_{DD} or I_{DDQ} measurement is started.

- Define D = {CS#, RAS#, CAS#, WE#} = {HIGH, LOW, LOW, LOW}
- Define D# = {CS#, RAS#, CAS#, WE#} = {HIGH, HIGH, HIGH, HIGH}

10 Electronical Characteristics and Timing

10.1 Clock Specification

The jitter specified is a random jitter meeting a Gaussian distribution. Input clocks violating the min/max values may result in malfunction of the DDR3L SDRAM device.

10.1.1 Definition for $t_{CK(AVG)}$

$t_{CK(AVG)}$ is calculated as the average clock period across any consecutive 200 cycle window, where each clock period is calculated from rising edge to rising edge.

$$t_{CK(\text{avg})} = \left(\sum_{j=1}^N t_{CKj} \right) / N \quad N=200$$

10.1.2 Definition for $t_{CK(\text{abs})}$

$t_{CK(\text{abs})}$ is defined as the absolute clock period, as measured from one rising edge to the next consecutive rising edge. $t_{CK(\text{abs})}$ is not subject to production test.

10.1.3 Definition for $t_{CH(\text{avg})}$ and $t_{CL(\text{avg})}$

$t_{CH(\text{avg})}$ is defined as the average high pulse width, as calculated across any consecutive 200 high pulses

$$t_{CH(\text{avg})} = \left(\sum_{j=1}^N t_{CHj} \right) / (N \times t_{CK(\text{avg})}) \quad N=200$$

$t_{CL(\text{avg})}$ is defined as the average low pulse width, as calculated across any consecutive 200 low pulses.

$$t_{CL(\text{avg})} = \left(\sum_{j=1}^N t_{CLj} \right) / (N \times t_{CK(\text{avg})}) \quad N=200$$

10.1.4 Definition for $t_{JIT(\text{per})}$ and $t_{JIT(\text{per}, \text{lck})}$

$t_{JIT(\text{per})}$ is defined as the largest deviation of any signal t_{CK} from $t_{CK(\text{AVG})}$.

$t_{JIT(\text{per})} = \text{min/max of } \{t_{CKi} - t_{CK(\text{AVG})} \text{ where } i = 1 \text{ to } 200\}$.

$t_{JIT(\text{per})}$ defines the single period jitter when the DLL is already locked.

$t_{JIT(\text{per}, \text{lck})}$ uses the same definition for single period jitter, during the DLL locking period only.

$t_{JIT(\text{per})}$ and $t_{JIT(\text{per}, \text{lck})}$ are not subject to production test.

10.1.5 Definition for $t_{JIT(\text{cc})}$ and $t_{JIT(\text{cc}, \text{lck})}$

$t_{JIT(\text{cc})}$ is defined as the absolute difference in clock period between two consecutive clock cycles.

$t_{JIT(\text{cc})} = \text{max of } \{|t_{CKi+1} - t_{CKi}|\}$.

$t_{JIT(\text{cc})}$ defines the cycle to cycle jitter when the DLL is already locked.

$t_{JIT(\text{cc}, \text{lck})}$ uses the same definition for cycle to cycle jitter, during the DLL locking period only.

$t_{JIT(\text{cc})}$ and $t_{JIT(\text{cc}, \text{lck})}$ are not subject to production test.

10.1.6 Definition for $t_{ERR(\text{nper})}$

t_{ERR} is defined as the cumulative error across multiple consecutive cycles from $t_{CK(\text{AVG})}$. t_{ERR} is not subject to production test.

10.3.1 Speed Bin Table Note

Note:

1. The CL setting and CWL setting result in $t_{CK(AVG)min}$ and $t_{CK(AVG)max}$ requirements. When selecting $t_{CK(AVG)}$, both need to be fulfilled requirements from CL setting as well as requirements from CWL setting.
2. $t_{CK(AVG)min}$ limits: since CAS Latency is not purely analog-data and strobe output are synchronized by the DLL-all possible intermediate frequencies may not be guaranteed. An application should use the next smaller JEDEC standard $t_{CK(AVG)}$ value (3.0, 2.5, 1.875, 1.5, 1.25, 1.07 or 0.938ns) when calculating $CL [nCK] = t_{AA} [\text{ns}] / t_{CK(AVG)} [\text{ns}]$, rounding up to the next "Supported CL", where $t_{CK(AVG)} = 3.0\text{ns}$ should only be used for $CL = 5$ calculation.
3. $t_{CK(AVG)max}$ limits: calculate $t_{CK(AVG)} = t_{AAmax}/CL \text{ SELECTED}$ and round the resulting $t_{CK(AVG)}$ down to the next valid speed bin (3.3, 2.5, 1.875, 1.5, 1.25, 1.07 or 0.938ns). This result is $t_{CK(AVG)max}$ corresponding to CL SELECTED.
4. 'Reserved' settings are not allowed. User must program a different value.
5. Any DDR3L/DDR3-1866 speed bin also supports functional operation at lower frequencies as shown in the corresponding table which are not subject to Production Tests but verified by Design/Characterization.
6. Any DDR3L/DDR3-2133 speed bin also supports functional operation at lower frequencies as shown in the corresponding table which are not subject to Production Tests but verified by Design/Characterization.
7. DDR3L-800 AC timing apply if DRAM operates at lower than 800MT/s data rate.
8. For devices supporting optional down binning to $CL = 11$, $CL = 9$ and $CL = 7$, $t_{AA}/t_{RCD}/t_{RPmin}$ must be 13.125ns. SPD setting must be programmed to match.

11.3 Jitter Notes

Note:

- a. Unit 'tCK(AVG)' represents the actual $t_{CK(AVG)}$ of the input clock under operation. Unit 'nCK' represents one clock cycle of the input clock, counting the actual clock edges. ex $t_{MRD} = 4$ [nCK] means, if one MODE REGISTER SET command is registered at Tm, another MODE REGISTER SET command may be registered at $Tm + 4$, even if $(Tm + 4 - Tm)$ is $4 \times t_{CK(AVG)} + t_{ERR(4per)min}$.
- b. These parameters are measured from a command/address signal (CKE, CS#, RAS#, CAS#, WE#, ODT, BA0, A0, A1, etc.) transition edge to its respective clock signal (CK/CK#) crossing. The spec values are not affected by the amount of clock jitter applied (i.e., $t_{JIT(per)}$, $t_{JIT(cc)}$, etc.), as the setup and hold are relative to the clock signal crossing that latches the command/address. That is, these parameters should be met whether clock jitter is present or not.
- c. These parameters are measured from a data strobe signal (DQS(L/U), DQS(L/U) #) crossing to its respective clock signal (CK, CK#) crossing. The spec values are not affected by the amount of clock jitter applied (i.e., $t_{JIT(per)}$, $t_{JIT(cc)}$, etc.), as these are relative to the clock signal crossing. That is, these parameters should be met whether clock jitter is present or not.
- d. These parameters are measured from a data signal (DM(L/U), DQ(L/U)0, DQ(L/U)1, etc.) transition edge to its respective data strobe signal (DQS(L/U), DQS(L/U) #) crossing.
- e. For these parameters, the DDR3 SDRAM device supports $t_{nPARAM} [nCK] = RU \{t_{PARAM} [ns]/t_{CK(AVG)} [ns]\}$, which is in clock cycles, assuming all input clock jitter specifications are satisfied. For example, the device will support $t_{nRP} = RU \{t_{RP}/t_{CK(AVG)}\}$, which is in clock cycles, if all input clock jitter specifications are met. This means: For DDR3L/DDR3-800 6-6-6, of which $t_{RP} = 15$ ns, the device will support $t_{nRP} = RU \{t_{RP}/t_{CK(AVG)}\} = 6$, as long as the input clock jitter specifications are met, i.e. PRECHARGE command at Tm and ACTIVE command at $Tm+6$ is valid even if $(Tm + 6 - Tm)$ is less than 15ns due to input clock jitter.
- f. When the device is operated with input clock jitter, this parameter needs to be derated by the actual $t_{ERR(mper)}$, act of the input clock, where $2 \leq m \leq 12$. (Output deratings are relative to the SDRAM input clock.)
 For example, if the measured jitter into a DDR3L/DDR3-800 SDRAM has $t_{ERR(mper),act,min} = -172$ ps and $t_{ERR(mper),act,max} = +193$ ps, then $t_{DQSCK,min(derated)} = t_{DQSCK,min} - t_{ERR(mper),act,max} = -400$ ps - 193ps = -593ps and $t_{DQSCK,max(derated)} = t_{DQSCK,max} - t_{ERR(mper),act,min} = 400$ ps + 172ps = +572ps. Similarly, $t_{LZ(DQ)}$ for DDR3L-800 derates to $t_{LZ(DQ),min(derated)} = -800$ ps - 193ps = -993ps and $t_{LZ(DQ),max(derated)} = 400$ ps + 172ps = +572ps. (Caution on the min/max usage).
 Note that $t_{ERR(mper),act,min}$ is the minimum measured value of $t_{ERR(nper)}$ where $2 \leq n \leq 12$, and $t_{ERR(mper),act,max}$ is the maximum measured value of $t_{ERR(nper)}$ where $2 \leq n \leq 12$.
- g. When the device is operated with input clock jitter, this parameter needs to be derated by the actual $t_{JIT(per)}$, act of the input clock. (output deratings are relative to the SDRAM input clock) For example, if the measured jitter into a DDR3L/DDR3-800 SDRAM has $t_{CK(AVG),act} = 2500$ ps, $t_{JIT(per),act,min} = -72$ ps and $t_{JIT(per),act,max} = +93$ ps, then $t_{RP,derated} = t_{RP,act} + t_{JIT(per),act,min} = 0.9 \times t_{CK(AVG),act} + t_{JIT(per),act,min} = 0.9 \times 2500$ ps - 72ps = +2178ps. Similarly, $t_{QH,min(derated)} = t_{QH,min} + t_{JIT(per),act,min} = 0.38 \times t_{CK(AVG),act} + t_{JIT(per),act,min} = 0.38 \times 2500$ ps - 72ps = +878ps. (Caution on the min/max usage.)

11.4 Timing Parameter Notes

Note:

1. Actual value dependent upon measurement level definitions. See "Method for calculating t_{WPRE} transitions and endpoints" and "Method for calculating t_{WPST} transitions and endpoints".
2. Commands requiring a locked DLL are: READ (and RAP) and synchronous ODT commands.
3. The max values are system dependent.
4. WR as programmed in mode register.
5. Value must be rounded-up to next higher integer value.
6. There is no maximum cycle time limit besides the need to satisfy the refresh interval, t_{REFI}.
7. For definition of RTT turn-on time t_{AON}.
8. For definition of RTT turn-off time t_{AOF}.
9. t_{WR} is defined in ns, for calculation of t_{WRPDEN} it is necessary to round up t_{WR}/t_{CCK} to the next integer.
10. WR in clock cycles as programmed in MR0.
11. The maximum READ postamble is bound by t_{DQCKmin} plus t_{QSHmin} on the left side and t_{HZ(DQS)max} on the right side. See "Clock to data strobe relationship".
12. Output timing deratings are relative to the SDRAM input clock. When the device is operated with input clock jitter, this parameter needs to be derated by t.b.d.
13. Value is only valid for R_{ON34}.
14. Single-ended signal parameter.
15. t_{REFI} depends on T_{OPER}.
16. t_{S(base)} and t_{IH(base)} values are for 1V/ns CMD/ADD single-ended slew rate and 2V/ns CK, CK# differential slew rate.
Note for DQ and DM signals, V_{REF(DC)} = V_{REFDQ(DC)}. For input only pins except RESET#, V_{REF(DC)} = V_{REFCA(DC)}. See "Address/ Command Setup, Hold and Derating" in Section 11.5.
17. t_{DS(base)} and t_{DH(base)} values are for 1V/ns DQ single-ended slew rate and 2V/ns DQS, DQS# differential slew rate.
Note for DQ and DM signals, V_{REF(DC)} = V_{REFDQ(DC)}. For input only pins except RESET#, V_{REF(DC)} = V_{REFCA(DC)}. See "Data Setup, Hold and Slew Rate Derating" in Section 11.6.
18. Start of internal write transaction is defined as follows:
For BL8 (fixed by MRS and on-the-fly): Rising clock edge 4 clock cycles after WL.
For BC4 (on-the-fly): Rising clock edge 4 clock cycles after WL.
For BC4 (fixed by MRS): Rising clock edge 2 clock cycles after WL.
19. The maximum READ preamble is bound by t_{LZ(DQS)min} on the left side and t_{DQCKmax} on the right side.
20. CKE is allowed to be registered LOW while operations such as row activation, precharge, auto-precharge or refresh are in progress, but power-down IDD spec will not be applied until finishing those operations.
21. Although CKE is allowed to be registered LOW after a REFRESH command once t_{REFPDENmin} is satisfied, there are cases where additional time such as t_{XPDLLmin} is also required.
22. Defined between end of MPR read burst and MRS which reloads MPR or disables MPR function.
23. One ZQCS command can effectively correct a minimum of 0.5% (ZQ Correction) of R_{ON} and RTT impedance error within 64 nCK for all speed bins assuming the maximum sensitivities specified in the 'Output Driver Voltage and Temperature Sensitivity' and 'ODT Voltage and Temperature Sensitivity' tables. The appropriate interval between ZQCS commands can be determined from these tables and other application-specific parameters.
One method for calculating the interval between ZQCS commands, given the temperature (Tdriffrate) and voltage (Vdriffrate) drift rates that the SDRAM is subject to in the application, is illustrated. The interval could be defined by the following formula:

$$\frac{\text{ZQCorrection}}{(TSens \times Tdriffrate) + (VSens \times Vdriffrate)}$$

where TSens = max (dR_{TdT}, dR_{OND}) and VSens = max (dR_{TdV}, dR_{OND}) defines the SDRAM temperature and voltage sensitivities.

For example, if TSens = 1.5%/°C, VSens = 0.15%/mV, Tdriffrate = 1°C/sec and Vdriffrate = 15mV/sec, then the interval between ZQCS commands is calculated as:

$$\frac{0.5}{(1.5 \times 1) + (0.15 \times 15)} = 0.133 \approx 128\text{ms}$$

24. n = from 13 cycles to 50 cycles. This row defines 38 parameters.
25. t_{CH(abs)} is the absolute instantaneous clock high pulse width, as measured from one rising edge to the following falling edge.
26. t_{CL(abs)} is the absolute instantaneous clock low pulse width, as measured from one falling edge to the following rising edge.

27. The $t_{TIS(BASE, AC150)}$ specifications are adjusted from the $t_{IS(base)}$ specification by adding an additional 100 ps of derating to accommodate for the lower alternate threshold of 150mV and another 25ps to account for the earlier reference point [(175 mv - 150mV)/1V/ns].
28. Pulse width of an input signal is defined as the width between the first crossing of $V_{REF(DC)}$ and the consecutive crossing of $V_{REF(DC)}$.
29. t_{DQSL} describes the instantaneous differential input low pulse width on DQS - DQS#, as measured from one falling edge to the next consecutive rising edge.
30. t_{DQSH} describes the instantaneous differential input high pulse width on DQS - DQS#, as measured from one rising edge to the next consecutive falling edge.
31. $t_{DQSH, act} + t_{DQSL, act} = 1tCK$, act with t_{XYZ} , act being the actual measured value of the respective timing parameter in the application.
32. $t_{DSH, act} + t_{DSS, act} = 1tCK$, act with t_{XYZ} , act being the actual measured value of the respective timing parameter in the application.

11.5 Address/Command Setup, Hold and Derating

For all input signals the total t_{IS} (setup time) and t_{IH} (hold time) required is calculated by adding the datasheet $t_{IS(base)}$ and $t_{IH(base)}$ value (see Table 49) to the Δt_{IS} and Δt_{IH} derating value (see Table 51) respectively.

Example: t_{IS} (total setup time) = $t_{IS(base)} + \Delta t_{IS}$.

Setup (t_{IS}) nominal slew rate for a rising signal is defined as the slew rate between the last crossing of $V_{REF(DC)}$ and the first crossing of $V_{IH(AC)min}$. Setup (t_{IS}) nominal slew rate for a falling signal is defined as the slew rate between the last crossing of $V_{REF(DC)}$ and the first crossing of $V_{IL(AC)max}$. If the actual signal is always earlier than the nominal slew rate line between shaded 'V_{REF(DC)} to AC region', use nominal slew rate for derating value (see Figure 24). If the actual signal is later than the nominal slew rate line anywhere between shaded 'V_{REF(DC)} to AC region', the slew rate of a tangent line to the actual signal from the AC level to V_{REF(DC)} level is used for derating value (see Figure 26).

Hold (t_{IH}) nominal slew rate for a rising signal is defined as the slew rate between the last crossing of $V_{IL(AC)max}$ and the first crossing of $V_{REF(DC)}$. Hold (t_{IH}) nominal slew rate for a falling signal is defined as the slew rate between the last crossing of $V_{IH(DC)min}$ and the first crossing of $V_{REF(DC)}$. If the actual signal is always later than the nominal slew rate line between shaded 'DC to V_{REF(DC)} region', use nominal slew rate for derating value (see Figure 25). If the actual signal is earlier than the nominal slew rate line anywhere between shaded 'DC to V_{REF(DC)} region', the slew rate of a tangent line to the actual signal from the DC level to V_{REF(DC)} level is used for derating value (see Figure 26).

For a valid transition the input signal has to remain above/below $V_{IH/L(AC)}$ for some time t_{VAC} (see Table 58). Although for slow slew rates the total setup time might be negative (i.e. a valid input signal will not have reached $V_{IH/L(AC)}$ at the time of the rising clock transition), a valid input signal is still required to complete the transition and reach $V_{IH/L(AC)}$. For slew rates in between the values listed in Table 51 the derating values may obtain by linear interpolation. These values are typically not subject to production test. They are verified by design and characterization.

11.6 Data Setup, Hold and Slew Rate Derating

For all input signals the total t_{DS} (setup time) and t_{DH} (hold time) required is calculated by adding the data sheet $t_{DS(base)}$ and $t_{DH(base)}$ values to the Δt_{DS} and Δt_{DH} derating value respectively.

Example: t_{DS} (total setup time) = $t_{DS(base)}$ + Δt_{DS} .

Setup (t_{DS}) nominal slew rate for a rising signal is defined as the slew rate between the last crossing of $V_{REF(DC)}$ and the first crossing of $V_{IH(AC)min}$. Setup (t_{DS}) nominal slew rate for a falling signal is defined as the slew rate between the last crossing of $V_{REF(DC)}$ and the first crossing of $V_{IL(AC)max}$ (see Figure 28). If the actual signal is always earlier than the nominal slew rate line between shaded ' $V_{REF(DC)}$ to AC region', use nominal slew rate for derating value. If the actual signal is later than the nominal slew rate line anywhere between shaded ' $V_{REF(DC)}$ to AC region', the slew rate of a tangent line to the actual signal from the AC level to DC level is used for derating value (see Figure 30).

Hold (t_{DH}) nominal slew rate for a rising signal is defined as the slew rate between the last crossing of $V_{IL(AC)max}$ and the first crossing of $V_{REF(DC)}$. Hold (t_{DH}) nominal slew rate for a falling signal is defined as the slew rate between the last crossing of $V_{IH(DC)min}$ and the first crossing of $V_{REF(DC)}$ (see Figure 29). If the actual signal is always later than the nominal slew rate line between shaded 'DC level to $V_{REF(DC)}$ region', use nominal slew rate for derating value. If the actual signal is earlier than the nominal slew rateline anywhere between shaded 'DC to $V_{REF(DC)}$ region', the slew rate of a tangent line to the actual signal from the DC level to $V_{REF(DC)}$ level is used for derating value (see Figure 31).

For a valid transition the input signal has to remain above/below $V_{IH/L(AC)}$ for some time t_{VAC} . Although for slow slew rates the total setup time might be negative (i.e., a valid input signal will not have reached $V_{IH/L(AC)}$ at the time of the rising clock transition) a valid input signal is still required to complete the transition and reach $V_{IH/L(AC)}$.

For slew rates in between the values listed in the tables the derating values may obtained by linear interpolation. These values are typically not subject to production test. They are verified by design and characterization.
